

Can EMMA solve the puzzle of the knee?

T. Kalliokoski for EMMA collaboration
University of Jyväskylä

Knee

K. Nakamura *et al.* (Particle Data Group), J. Phys. G **37**, 075021 (2010)

Knee explanations?

- 4 classes of explanations (see for example J.R. Hörandel, *Astroparticle physics* 21 (2004) 241)
- | Changes in acceleration processes around the knee energy (more numerous lower energy processes run out of steam)
 - | Models with variations of diffusive shock acceleration
 - Different A/Z dependencies between models
 - | Galactic wind re-acceleration model
 - Z dependence
 - | Cannonball model (A. De Rújula, *Nucl. Phys. B (Proc. Suppl.)* 151 (2006) 23)

Knee explanations 2?

- | Leakage of cosmic rays from the Galaxy with non-changing spectral slope from the acceleration
 - | Models with leakage through diffusion and/or drift
 - Different Z and A dependencies between models
- | Losses via interactions with background particles in the Galaxy
 - | For example pair-production, pion-photoproduction on nucleons and photo-disintegration of nuclei
 - Some of these effects have A dependence.

Knee explanations 3?

| NEW PHYSICS

- | Experiments at and above knee are not measuring cosmic ray particles directly. They measure the shower of particles created by cosmic ray particle hitting atom in atmosphere. The analyses are based on simulations beyond measured cross-sections.

Extensive Air Showers

1 PeV

Proton | Iron

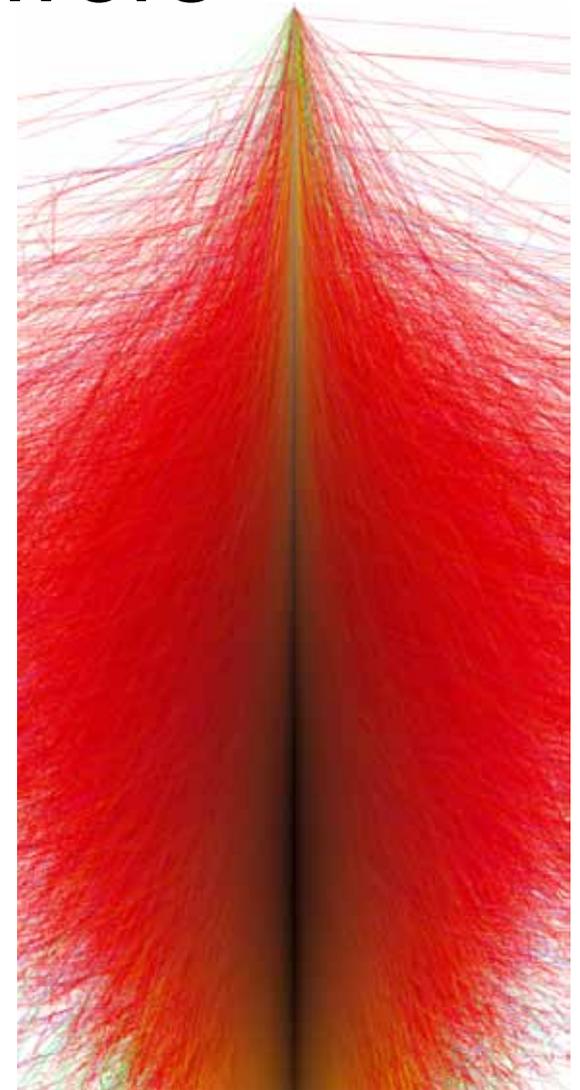

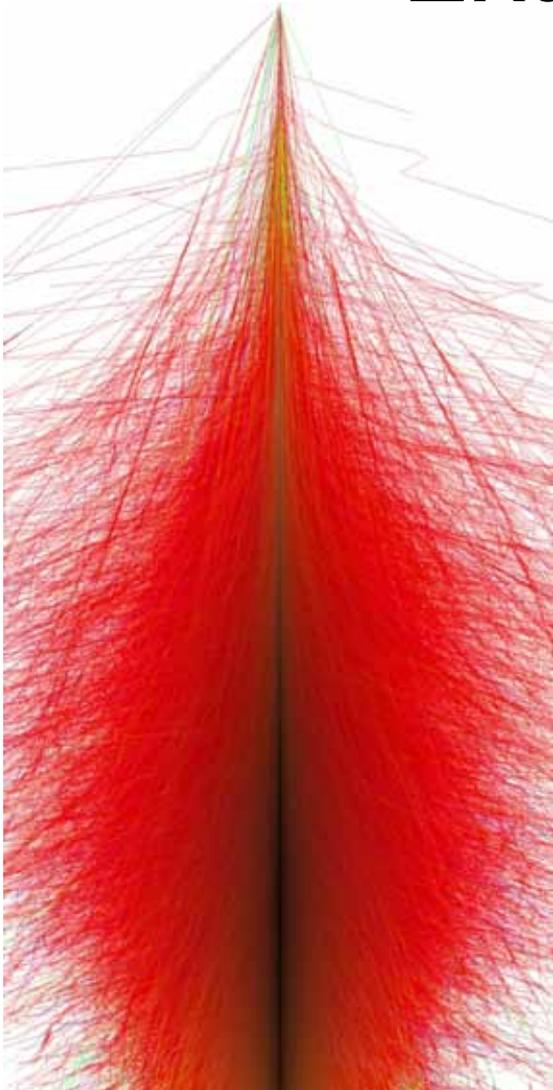

e^+ , e^- and photons

muons

hadrons

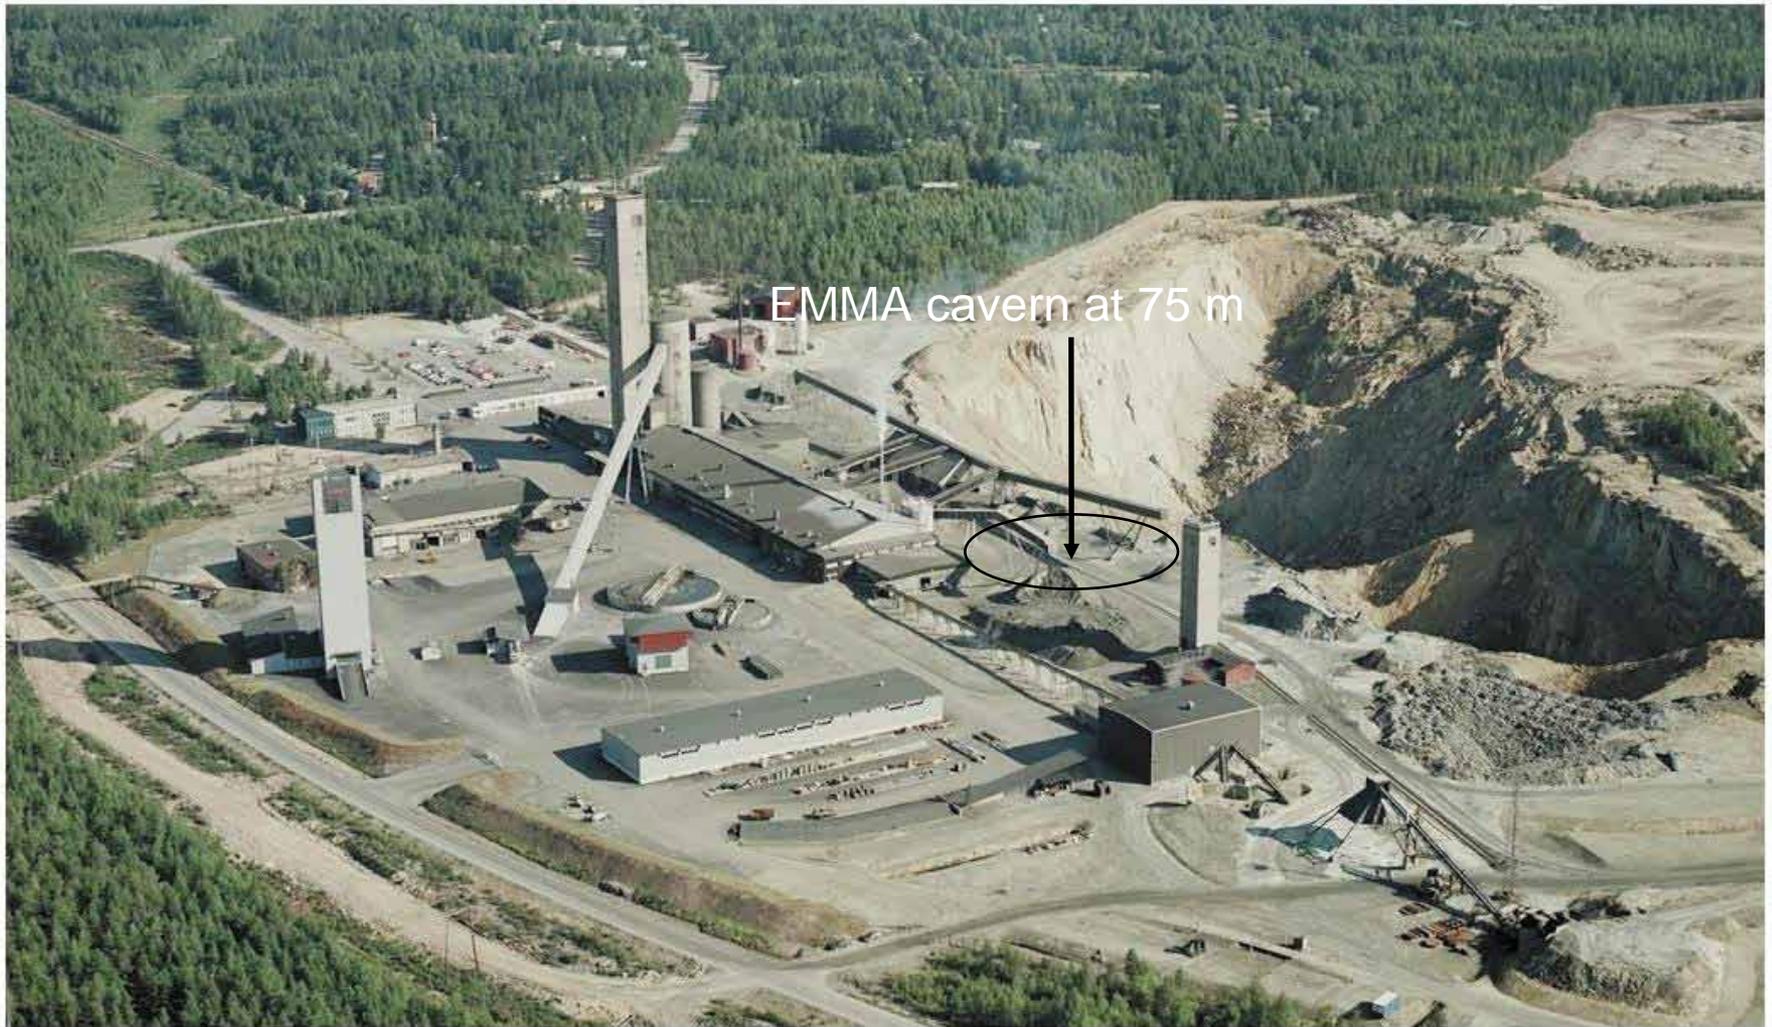

F. Schmidt, "CORSIKA
shower images",

Shower reconstruction 1

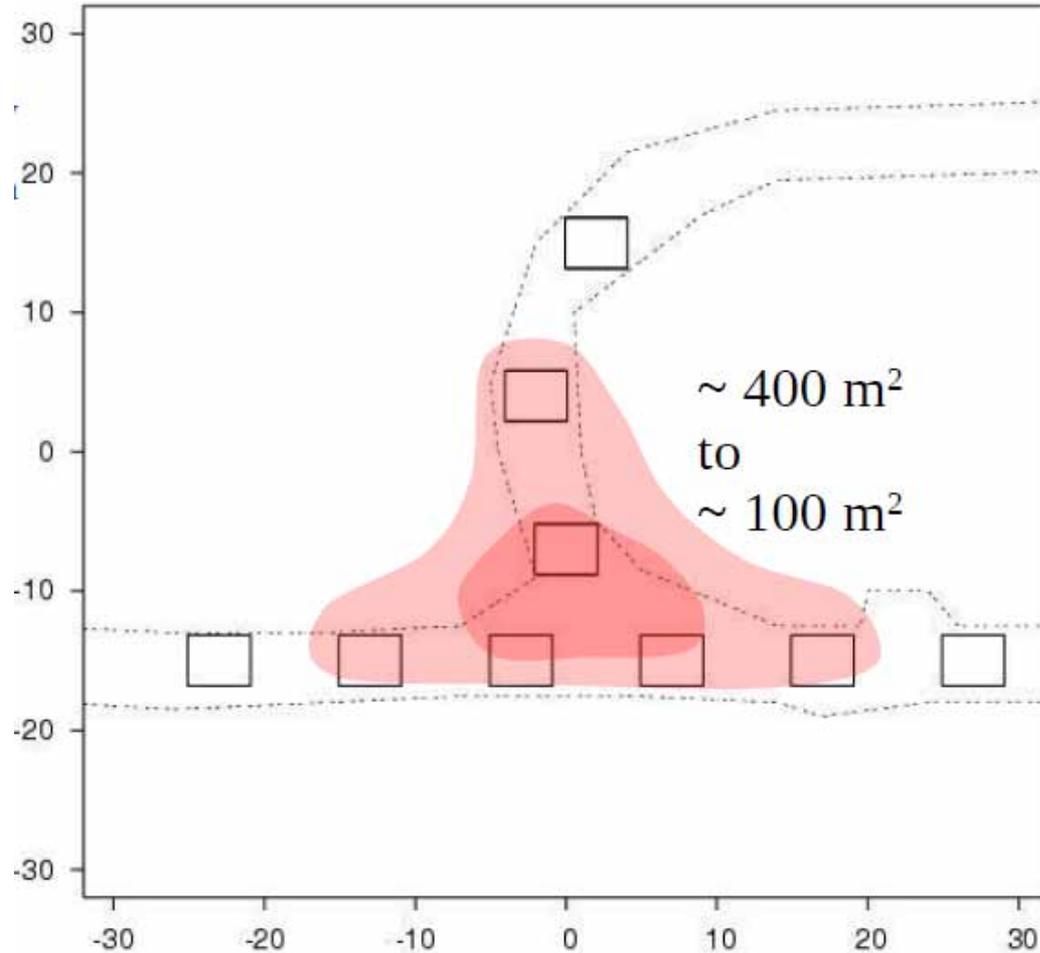

4.0 PeV proton

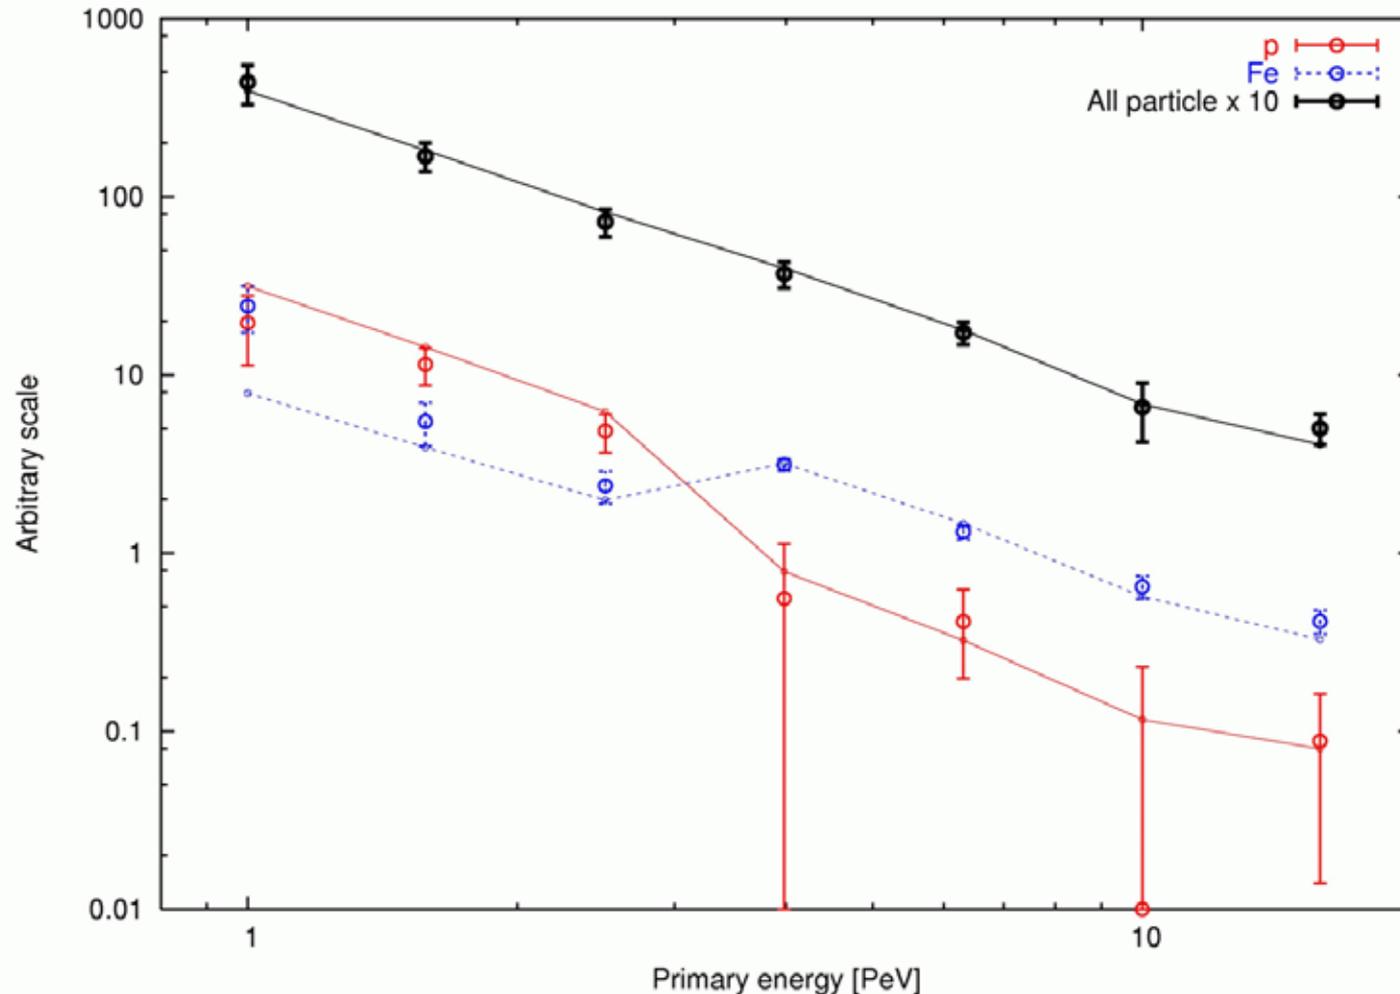

X denotes the shower axis position and

X is the reconstructed pos.

EMMA Detectors effective area

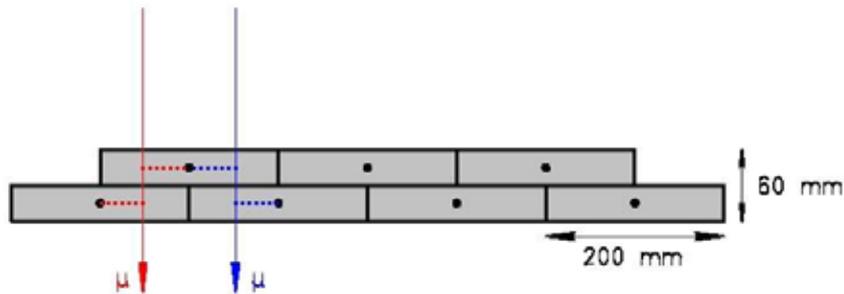

Simulated change of p / Fe ratio from 80/20 to 20/80 reconstructed by EMMA after 12 months running

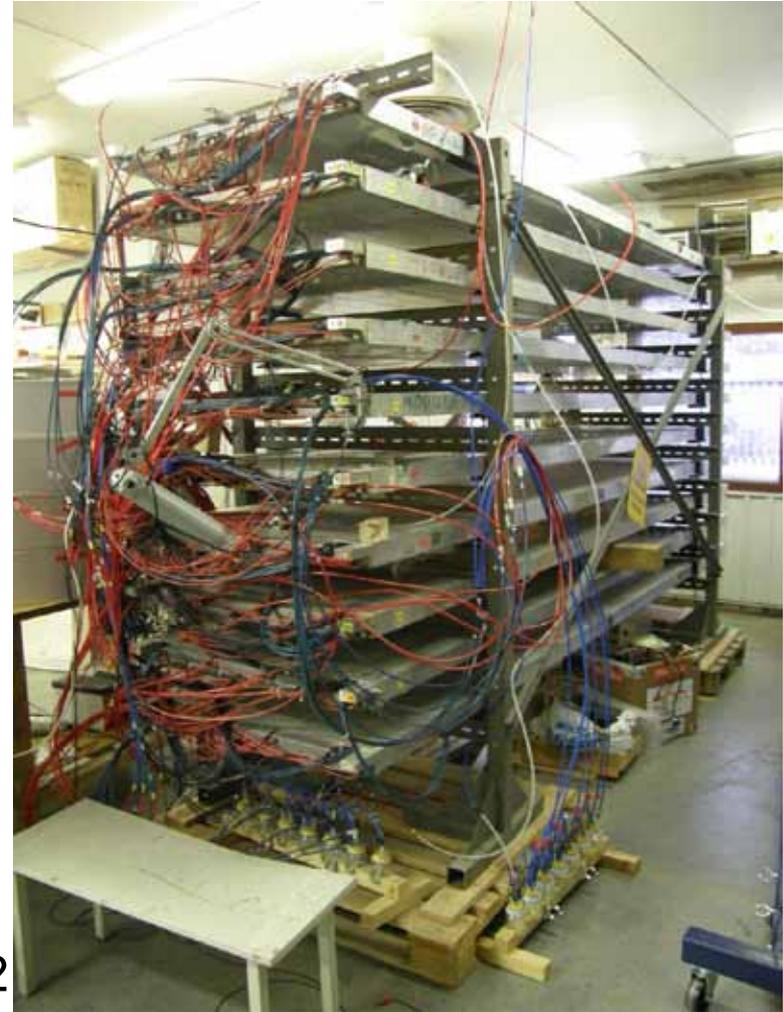

EMMA Detectors

Drift chambers from Delphi
(MUB)

- Single detector element (plank) consists out of 7 chambers, each $20 \times 365 \text{ cm}^2$

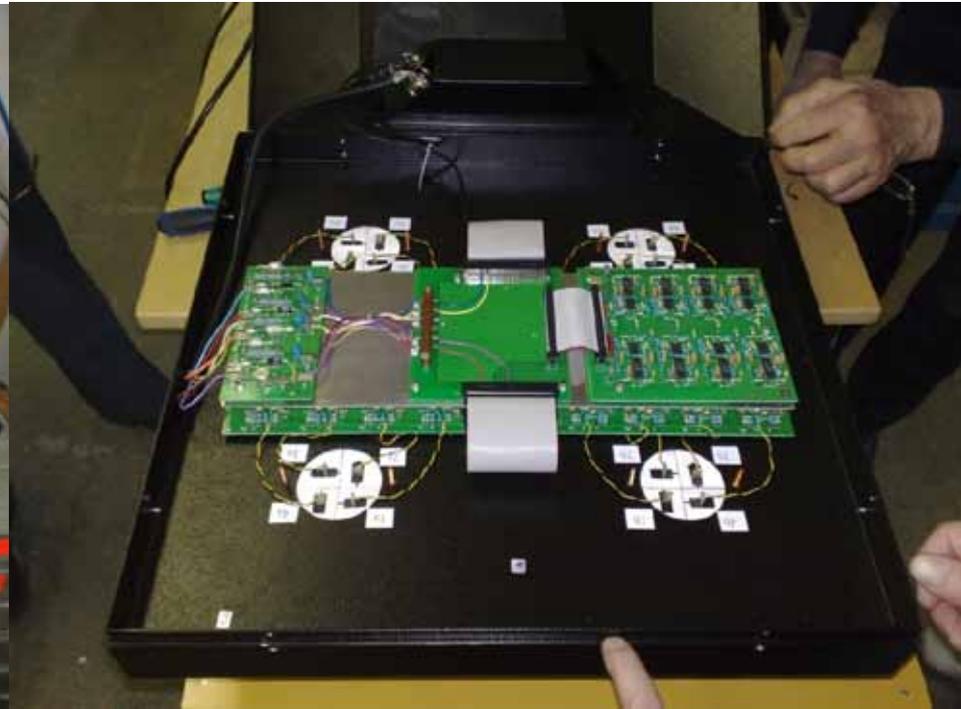

- Position resolution $\sim 1 \text{ cm}^2$

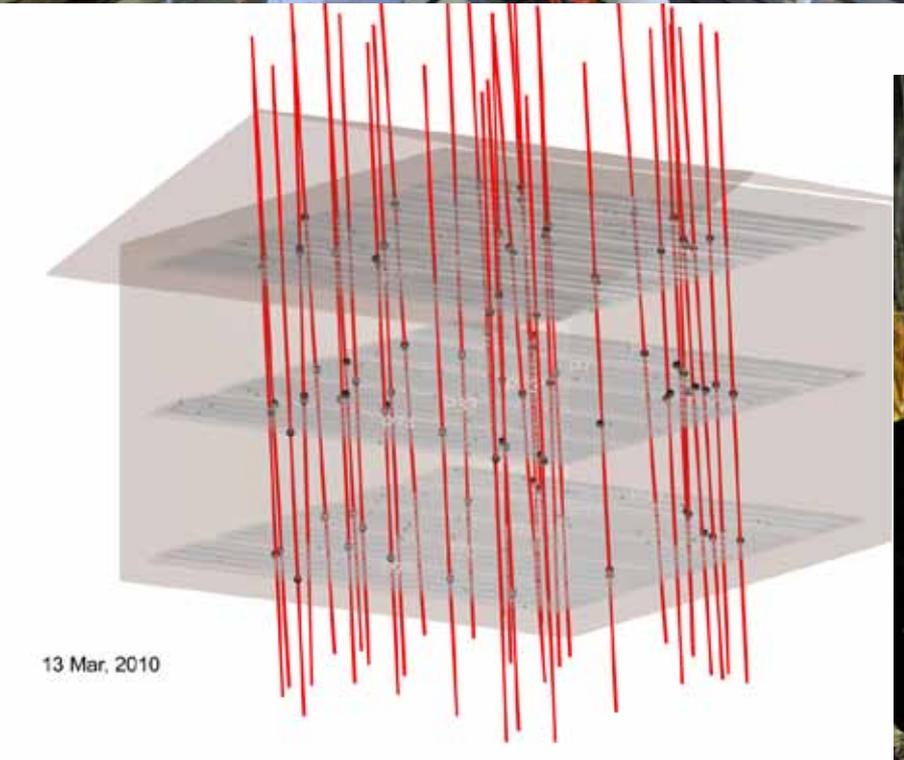

EMMA Detectors 2

Plastic scintillators

- $50 \times 50 \text{ cm}^2$, height $\gg 13 \text{ cm}$, $m \gg 20 \text{ kg}$,
- arranged to 16 individual pixels, $12 \times 12 \text{ cm}^2$, 3 cm thick each,
- employ APDs (avalanche photodiodes),
- time resolution $\sim 1 \text{ ns}$.
- to be used for trigger and improving tracks
